9. Note the attached Information Disclosure Statement(s)(PTO-1449) Paper No(s).

Continuation of 5. does NOT place the application in condition for allowance because: of the reasons of record. The 35 USC 112, first paragraph rejection concerning written description is maintained since the specification does not teach that the inventor was in possessio of the invention of treating an established disorder requiring angiogenesis at the time the invention was made. The claim reads on treating humans and that was not done in the instant specification. While applicants arguments concerning the disclosure of mice is noted, it is no humans. Concerning the enablement rejection, the claims are not enabled for the reasons of record since the mouse model is all the is used and it would have taken undue experiemtation to see if humans also would have been able to be treated as claimed. The specification shows that the chondroitinase can be used to reduce tumor cell growth but not to decrease angiogenesis. In terms of the ar applicant argues that Brown is only used to treat unwanted carttilage tissue not tumors but it is also noted that the chondroitinase in Brow is used to treat eye conditions which would not have cartilage in them. Applicant argues that the mechanism in Takeuchi is different than applicant's but the administration is the same as applicant. The chondroitinase is administered directly to the patient. Takeuchi states on page 119, left column, that the chondroitinase inhibits the growth in vivo of the tumor, so how could the enzyme in that situation not reduc angiogenesis if the claimed disorders require angiogenesis and the enzyme inhibits the tumor, thus the angiogenesis is reduced. Applicant argues that Ibex teaches using chondroitinase to treat wounds but applicant in their own disclosure at page 10 as describe that the chondroitinase can be used to treat scars which are wounds. Applicants argue that Sasisehkaran teaches using a heparinase to reduce angiogenesis. The secondary reference were used to provide motivation to use a chondroitinase instead of the heparinase to reduce angiogenesis. Thus, the rejections are maintained. .
